## Disciplinary knowledge (KS1)

The below tables outlines where disciplinary knowledge – the working scientifically elements – is **first taught** and deliberately practised in KS1 or KS2. The curriculum has been sequenced so that the content is also reviewed in subsequent units (and may also be reviewed in other subject areas like geography and history), but to keep the table readable, we have only set out where it is first taught. The Mathematics <u>Programmes of Study</u> have been considered so that pupils never need to apply mathematical skills (e.g. calculating mean, rounding to an appropriate degree, constructing graphs) until they have first been taught in mathematics lessons.

	Scientific Attitudes & Planning (A&P)	Measuring & Observing (M&O)	Recording & Presenting (R&P)	Analysing & Evaluating (A&E)
YFS	Make predictions about what might happen when I try something	Measure/observe using senses     Observe using a magnifying glass safely	Use hoops to classify objects based on simple criteria	- Notice patterns in the world around me
Y1	Scientists look for patterns in the world around them     Scientists group objects or living things based on their properties     Scientists conduct secondary research to learn from what other scientists have already learned	Gather information from text/ books/ images	Record numerical or descriptive observations in a table Draw a diagram, a simple scientific drawing that explains or informs Use a table to classify items based on properties Use a Carroll diagram to classify items based on properties Use a Venn diagram to classify items into two or three sets based on properties	Make simple statements about the results of an enquiry
Y2	It is important that we keep as much as we can the same, apart from the one thing we measure and the one thing we change  Make a prediction based on substantive knowledge  There are four main stages of enquiry (A&P, M&O, R&P, A&E)  Scientists identify potential hazards in their experiments and plan ways to reduce them  Scientists conduct investigations to identify whether a pattern they think they've seen is really there	Make systematic observations of an object	Use a pair of axes to classify items based on the extent it displays two properties	Ask further questions that could be explored to extend findings

## Disciplinary knowledge (KS2)

		Scientific Attitudes & Planning	Measuring & Observing	Recording & Presenting	Analysing & Evaluating
_		(A&P)	(M&O)	(R&P)	(A&E)
	Y3	Select most appropriate equipment to measure (the variables) that will give you the best chance of an accurate result  A dependent variable is what you measure; an independent variable is what you change; controlled variables are things that stay the same  Scientists identify factors in an investigation that should be controlled, and try to find ways to control them  Write an appropriate method  Science is studied as three disciplines: biology (study of organisms), chemistry (study of materials) and physics (study of energy)	Gather information from the internet Anomalous results should be discarded and rerecorded  Data is repeatable if the same person repeats the investigation and gets the same results; data is reproducible if the investigation is repeated by a different person and the results are the same  Taking multiple readings allows you to see if your data is repeatable, and helps identify outliers	Design a table to collect data with the appropriate number of rows and columns and correct headings	Draw conclusions (e.g. 'the greater the, the greater the') Use scientific understanding to explain their findings Suggest ways to improve practical procedures to obtain more accurate measurements Use findings of investigation to make further predictions
	Y4	Set a hypothesis to test     Draw diagram of the investigation     Scientists use models to help explain their ideas	Gather information using a data logger (e.g. sound meter app; heart rate app)	Use a classification key to identify an object Draw a dichotomous classification key to help others identify an object Present information orally using a prop or demonstration Present information in a written format	Identify scientific evidence that has been used to support or refute ideas
	Y5	Science is studied as three disciplines: biology (study of organisms), chemistry (study of properties of matter and how it interacts with energy) and physics (study of energy) Scientists look for patterns in data to try to identify correlations Scientists must work out if the factor is the cause of the outcome in a correlation	Measure force using a <u>Newtonmeter</u>	Scatter graphs can help you decide if there is a relationship between two variables     (Geography: Interpret and construct climate graph)     Line graphs can be used when data is continuous; bar charts can be used when data is discrete	Make judgements on the accuracy of the data     Some people may agree or disagree with the use of some scientific discoveries     Science is never 'complete' and scientists are always working to make models more accurate or to discover new explanations
	Y6		<ul> <li>Taking multiple readings allows you to see if your data is repeatable, helps identify outliers and allows a mean to be calculated</li> </ul>	Decide which graph is most appropriate for the enquiry	Calculating the mean can be used as a method of analysing data
	KS3	• Evaluate risks	Pay attention to objectivity and concern for accuracy, precision, repeatability and reproducibility  Use a wider range of apparatus and techniques  Apply sampling techniques  Evaluate data, showing awareness of potential sources of random and systematic error	Use a range of graph types to display data, including pie charts, scatter graphs and line graphs	The difference between correlation and causation, and suggesting ways to test for both Understand that scientific methods and theories develop as earlier explanations are modified to take account of new evidence and ideas, together with the importance of publishing results and peer review
